ABSTRAK

Kasus komplikasi inkontensia dengan babesiosis terjadi pada anjing weimaraner. Anjing dengan jenis kelamin jantan, berumur 6 tahun, telah di kastrasi saat umur satu tahun. Anjing mempunyai sejarah kencing yang tidak terkontrol sejak 6 bulan lalu, pasien memiliki sejarah pernah menderita babesiosis berdasarkan test PCR (*Polymerase Chain Reaction*). Pasien datang ke Bali Veterinary Clinic, dengan gejala yang terlihat lemah, gusi pucat, epistaksis, rambut rontok, temperature tubuh 41,2°C dan nafsu makan menurun. Hasil pemeriksaan darah lengkap ditemukan kondisi anemia mikrositik hiperkromik, disertai trombositopenia (Platelet = 85). Sedangkan pada ulasan darah ditemukan positif parasit darah *Babesia* sp. Hasil pemeriksaan kimia darah didapatkan terjadi peningkatan total bilirubin dan direk bilirubin. Pemeriksaan mikroskopik urin hasilnya negative kristal. Terapi selama 28 hari dengan doxycycline, phenylpropanolamine HCl serta vitamin B12 terlihat efektif ditandai dengan kondisi anjing membaik, frekuensi kencing kembali normal, kembali aktif dan nafsu makan baik. Setelah 28 hari pasca terapi dilakukan pemeriksaan darah rutin menunjukkan tidak adanya anemia, hasil kimia darah menunjukkan level bilirubin kembali normal dan ulas darah menunjukkan negative babesiosis.

Kata kunci: Inkontinensia, babesiosis, anjing weimaraner
